

Air Temperature

Note-taking Guide - Answer Key

Fahrenheit, liquid, vary, air temperature, scale, warmer, thermometer

Air temperature is simply a measure of how hot or cold the air is.

We use a thermometer to measure the air temperature of a place. A thermometer has a colored liquid in the hollow glass tube that shows what the temperature is. When the temperature gets warmer, the liquid shoots up!

The scale printed on the side of the thermometer measures the temperature in units called degree Celsius or degree Fahrenheit.

Temperature can vary from season to season and from place to place.
